REST FUL API Configuration & usage

Quick Start Kit:

API Reference

The Well-Well API is organized around REST. Our API has predictable resource-oriented URLs, accepts form-encoded request bodies, returns JSON-encoded responses, and uses standard HTTP response codes, authentication, and verbs.

You can use the well-well UAT API in test mode, which does not affect your live data or interact with the well-well live backend. The API key you use to authenticate the request determines whether the request is live mode or test mode.

The Well-Well API differs for every account as we release new versions and tailor functionality.

Authentication:

Your API keys carry many privileges, so be sure to keep them secure! Do not share your secret API keys in publicly accessible areas such as GitHub, client-side code, and so forth.

Authentication to the API is performed via HTTP Basic Auth. Provide your API key as the basic AUTH username value. You do not need to provide a password.
